- 502 well-documented textual distinctions covering many fields in great detail
- a detailed implementation, using standard XML tools
- a modular and extensible architecture
- well-written and comprehensive Guidelines
- an independent, academic, governance
- a good and varied community of practice

TEI Old

- an academic research project — on soft money
- a codification of common practice — but with no formal development mechanism
- a community effort — with no clear licencing rules
- an overly complex and sophisticated system — usable only by the priesthood
- a naive and reductionist view of the complexities of real text — useful only to the amateur
- a software and hardware independent system — that doesn't actually work on anything because there are no tools to *do* something with a TEI text

TEI New

- Proper open source licence, with visible development on Sourceforge
- Architecture rethought to facilitate expansion and integration with other systems
- Self documenting, each release fully validated, delivered using standard mechanisms
- Publicly available processing tools managed together with the Guidelines
- Active developer community, wiki, etc. Test files, exemplars, regular updates...
- New governance structure, new tools, new modules...

New directions in TEI P5

- ① Be a good digital citizen:
 - Support for multiple schema languages and namespaces
 - Reliance on XML, and hence on Unicode
 - Validation of attributes and datatyping
 - Use of W3C pointers and paths
- ② Make it flexible:
 - ODD: a single specification language for developers, users, and teachers, integrating schema and documentation;
 - Verifiable conformance
- ③ Old annoyances removed and some new topics added

New Topics Treated

TEI P5: The Full

P5 includes significant new material:

- 1 manuscript description
- 2 manuscript transcription
- 3 data about persons and places
- 4 floating and overlapping texts
- 5 integration of text and graphics
- 6 markup documentation
- 7 internationalization features

TEI Conformance — James Cummings

Persons and places — Arianna Ciula

Facsimile markup — Dot Porter

Editorial intervention — Dan O'Donnell

Conversion from P4 to P5 — Syd Bauman

The TEI defines over 500 elements. We need some way of grouping them! We put them in **classes**, which are classified in two different ways:

- **attribute** classes contain elements which share the same attributes
- **model** classes contain elements which appear in the same place in the content models of other elements

Classes may themselves be classified: that is, a class may be defined as a combination of other classes. Subclasses are generally distinguished semantically.

Wherever possible, content models reference model classes rather than specific elements

TEI class names

TEI P5: The Full
Story

The TEI
infrastructure:
classes and
extensions —
Sebastian Rahtz

TEI
Conformance —
James
Cummings

Persons and
places —
Arianna Ciula

Facsimile
markup — Dot
Porter

Editorial
intervention —
Dan O'Donnell

Conversion
from P4 to P5 —
Syd Bauman

There are three styles of class name:

att.xxxx elements which share xxxx attributes, e.g.
att.linking

model.xxxLike elements which are semantically like an xxxx
e.g. **model.hiLike**

model.xxxPart elements which appear within an xxxxx e.g.
model.biblPart

Why use classes?

TEI P5: The Full
Story

Conversion
from P4 to P5 —
Syd Bauman

- Classes are easier to understand and remember than elements
- Adding a new element becomes a matter of deciding what it is 'Like', or what it is a 'Part' of
- Specialization of the TEI generic structure for specific needs becomes a simple declarative matter
- Customizations expressed in terms of class modifications are inherently interoperable

Uniformity of description

TEI P5: The Full
Story

- modules, elements, attributes, value-lists are treated uniformly
- each has an identifier, a gloss, a description, and one or more equivalents
- each can be added, changed, replaced, deleted within a given context
- for example, membership in the att.typed class gives you a generic type attribute, which can be over-ridden for specific class members

Overriding a value-list

Members of the class `model.hiLike` represent any kind of notable typographic highlighting. We can add new members simply:

```
<elementSpec
  ident="fraktur"
  mode="add"
  ns="http://www.example.org/ns/nonTEI">
  <desc>marks a passage using a fraktur-style typeface</desc>
  <classes>
    <memberOf key="model.hiLike"/>
  </classes>
</elementSpec>
```

If you do this, however, you meet issues of conformance — see later!

- The Conformance chapter is now not a chapter by itself, but a section of Chapter 23, "Using the TEI". It also has sections on:
 - Obtaining the TEI Schemas
 - Personalization and Customization
 - Implementation of an ODD System
- The notion of **TEI Conformance** is meant to assist in situations such as:
 - interchange of documents between users
 - software specifications for TEI-aware processing tools
 - archival deposit and distribution of TEI texts
 - specifying the form of project documents
- It is not an evaluation of scholarly merit or value for money. A document may be of major intellectual importance and yet not be TEI Conformant; a TEI Conformant document may also be of no scholarly value.

- **TEI Conformable:** can be transformed algorithmically into a TEI Conformant document without loss of information.
- **TEI Extension:** valid against a Schema which contains additional distinctions not present in the TEI Abstract Model and unable to be transformed without loss of information. Those parts which are not extensions should be TEI Conformant, or Conformable.
- **TEI Recommended Practice:** A TEI Conformant (or Conformable) document is said to follow TEI Recommended Practice if, wherever the Guidelines prefer one encoding practice to another, the preferred practice is used.

The TEI Namespace is new to TEI P5:

- Some of the benefits of using namespaces:
 - use of external schemas in their own namespace
 - inclusion of TEI schemas in non-TEI documents
 - preservation of TEI concepts and abstract model
- A **TEI Conformant** document must
 - declare all namespaces for the elements and attributes it uses
 - use the TEI namespace for elements which represent concepts from the TEI abstract model
 - declare new elements and attributes in a separate namespace
 - not put non-TEI elements or attributes into the TEI namespace
- **But TEI Conformance is not (necessarily) scholarly merit**

The TEI Namespace is new to TEI P5:

- Some of the benefits of using namespaces:
 - use of external schemas in their own namespace
 - inclusion of TEI schemas in non-TEI documents
 - preservation of TEI concepts and abstract model
- A **TEI Conformant** document must
 - declare all namespaces for the elements and attributes it uses
 - use the TEI namespace for elements which represent concepts from the TEI abstract model
 - declare new elements and attributes in a separate namespace
 - not put non-TEI elements or attributes into the TEI namespace
- But TEI Conformance is not (necessarily) scholarly merit

The ‘Names, Dates, People, and Places’ chapter has been extended further to allow for:

- Refined encoding of text where there are references to persons and places
- Integration with and creation of data structures (e.g. authority files, bio/prosopographical DB, gazetteers) related to persons and places
- Representation of canonical information about names (onomastics, toponymy)
- Coherent models across diverse data

Extensions

TEI P5: The Full

Editorial
intervention —
Dan O'Donnell

Conversion
from P4 to P5 —
Syd Bauman

The main extensions concern:

- Modelling of data about places at the intersection between history and geography
- Refined expression of date and time
- Definition for a canonical name or name-part of any kind
- Representation of organizations (businesses or institutions, racial or ethnic groupings or political factions) and organizational names

Place-names and Places

TEI P5: The Full Story

The TEI infrastructure: classes and extensions — Sebastian Rahtz

TEI Conformance — James Cummings

Persons and places — Arianna Ciula

Facsimile markup — Dot Porter

Editorial intervention — Dan O'Donnell

Conversion from P4 to P5 — Syd Bauman

Besides the possibility of encoding name components, new elements have been created for representing data about the places those names can refer to: `<listPlace>` and `<place>`.

- Geopolitical inclusion of places can be expressed by nesting and/or by stating explicit relationships: `<relationGrp>` and `<relation>`
- The conceptualization of States, Traits and Events inherited from the section on persons is also applied to places:
 - e.g. of traits: `<population>`, `<climate>`, `<terrain>`
 - the new element `<location>` is a kind of trait and is used to represent geographical location and geopolitical structures
 - within `<location>`, `<geo>` can be used to express latitude and longitude (recommended *datum*: WGS84)
- As for persons, responsibility and uncertainty about the sources can be asserted by using the attribute class `att.editLike`.

Dates and Periods

- Thanks to the mapping to W3C (`att.dataable.w3c`) and ISO date formats, automatic processing and validation of expression of dates and times are now allowed.
- Time periods and relative chronology can also be defined.

Nyms

Conversion
from P4 to P5 —
Syd Bauman

- The elements `<listNym>` and `<nym>` have been introduced to define canonical name or name-part of any kind.
- `<nym>`
 - can contain `model.entryParts` (e.g. `<form>`, `<orth>`, `<etym>`) and may also include a number of other `<nym>`s
 - in addition to global attributes and `att.typed`, it includes the attribute `@parts` to point to constituent `<nym>`s
- `@nymRef` has been added to the attribute class `att.naming` to refer to the canonical name.

The elements used for recording editorial intervention is in many ways very familiar (at least superficially): it employs many of the same elements, and adds elements that address nuances that were difficult to represent in older versions of the Guidelines.

But it has considerably improved on older versions in the recommended syntax. The new Guidelines:

- remove ambiguities present in the older system
- improve on practice that the older versions encouraged
- provide a powerful model for representing other types of interventions

The Familiar

TEI P5: The Full

Editorial
intervention —
Dan O'Donnell

Conversion
from P4 to P5 —
Syd Bauman

- Many of the elements for recording editorial intervention are (superficially) similar to the old versions of the guidelines:
 - Many familiar elements and concepts
 - `<abbr>`, `<expan>`, `<add>`, ``, `<app>`

The New

TEI P5: The Full
Story

The TEI
infrastructure:
classes and
extensions —
Sebastian Rahtz

TEI
Conformance —
James
Cummings

Persons and
places —
Arianna Ciula

Facsimile
markup — Dot
Porter

Editorial
intervention —
Dan O'Donnell

Conversion
from P4 to P5 —
Syd Bauman

- A number of new elements added to address issues that have come up before in discussions of things the old elements were not able to do well:
 - `<ex>` (editorial expansion) contains a sequence of letters added by an editor or transcriber when expanding an abbreviation.
 - `<am>` (abbreviation marker) contains a sequence of letters or signs present in an abbreviation which are omitted or replaced in the expanded form of the abbreviation.

The Better

TEI P5: The Full

TEI
Conformance —
James
Cummings

Persons and
places —
Arianna Ciula

Facsimile
markup — Dot
Porter

Editorial
intervention —
Dan O'Donnell

Conversion
from P4 to P5 —
Syd Bauman

- Where the guidelines differ the most from previous versions in their handling of editorial intervention is in their syntax
 - that is to say they way the old and new elements interact with each other
 - here the change is fairly fundamental, and represents a noticable improvement on the old system

<choice> and the Janus Tags

TEI P5: The Full
Story

The TEI
infrastructure:
classes and
extensions —
Sebastian Rahtz

TEI
Conformance —
James
Cummings

Persons and
places —
Arianna Ciula

Facsimile
markup — Dot
Porter

Editorial
intervention —
Dan O'Donnell

Conversion
from P4 to P5 —
Syd Bauman

- A key change in the new guidelines is the way they handle the old 'Janus Tags'
 - e.g. Previous ways of encoding abbreviations/expansions

```
<abbr>can't</abbr>  
<expan>cannot</expan>  
<abbr expan="cannot">can't</abbr> or  
  
<expan abbr="can't">cannot</expan>
```

Problems:

Editorial
intervention —
Dan O'Donnell

Conversion
from P4 to P5 —
Syd Bauman

- the relationship is not explicit
 - `<abbr><hi>p</hi>t</abbr><expn>pat</expn>`
- the `expn` or `abbr` attributes might themselves contain markup.
`<abbr expn="pat"><hi>p</hi>t</abbr><expn
abbr="<hi>p</hi>t">pat</expn>`
- The new solution is to make explicit the connection between the editorial intervention elements

```
<choice>  
  <abbr>  
    <hi>p</hi>t</abbr>  
  <expn>pat</expn>  
</choice>
```

Conversion
from P4 to P5 —
Syd Bauman

Conversion from P4 to an equivalent encoding in P5:

- likely to be pretty easy
- could be difficult if you have lots of extensions
 - even harder if your extensions are directly to a flat DTD and poorly documented
- requires use of namespaces

But ... migration gives you the opportunity to examine your encoding methodology, looking for

- new & better ways to do things
 - may have been available in P4
 - maybe not
- old, useless encoding — purge? encode differently?

What Needs Conversion?
